Deformable mirror developed in Padova

Behavior

Electrostatic push-pull mirror with single transparent electrode

Electrostatic push-pull mirror with patterned electrodes

Electrodes managing

P-P vs. P. only

Application to ultra-fast optics

## Bidirectional membrane deformable mirror

  - Electrostatic push-pull mirror with patterned electrodes
  - Electrodes managing
    - P-P vs. P. only
  - Application to ultra-fast optics

## DM developed in Padova: mirror technology

### Technology

- Thin cellulose membrane (5  $\mu\text{m}$ )
- Mirrors diameters: 12 mm, 18 mm, 25 mm
- 37 electrodes (up to 64), any pattern
- Initial RMS deviation from plane <50 nm
- Maximum deflection of 10  $\mu\text{m}$  (min  $f=2\text{m}$ )

### Advantages

- Compact device,
- low cost, low power
- New designs easy accessible

    - P-P vs. P. only
  - Application to ultra-fast optics

## DM developed in Padova: electronic devices

- PCB pattern example

- Actuators are independent

- High voltage, high frequency electrodes driver

- Up to 64 channels
- DSP technology
- Stand alone
- USB connection
- C++ environment

## Electrostatic Push Pull mirror

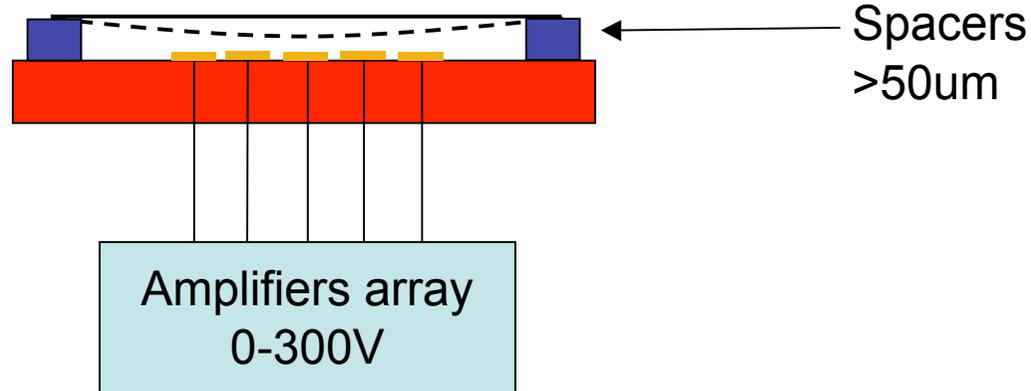

S. Bonora, L. Poletto, *Push-pull membrane mirrors for adaptive optics*, Optics Express 2006, Vol. 14 No. 25

- Electrostatic push-pull mirror with single transparent electrode
- Electrostatic push-pull mirror with patterned electrodes
- Electrodes managing
- P-P vs. P. only
- Application to ultra-fast optics

## Principle

Thin Membrane  
Al/Au Coated

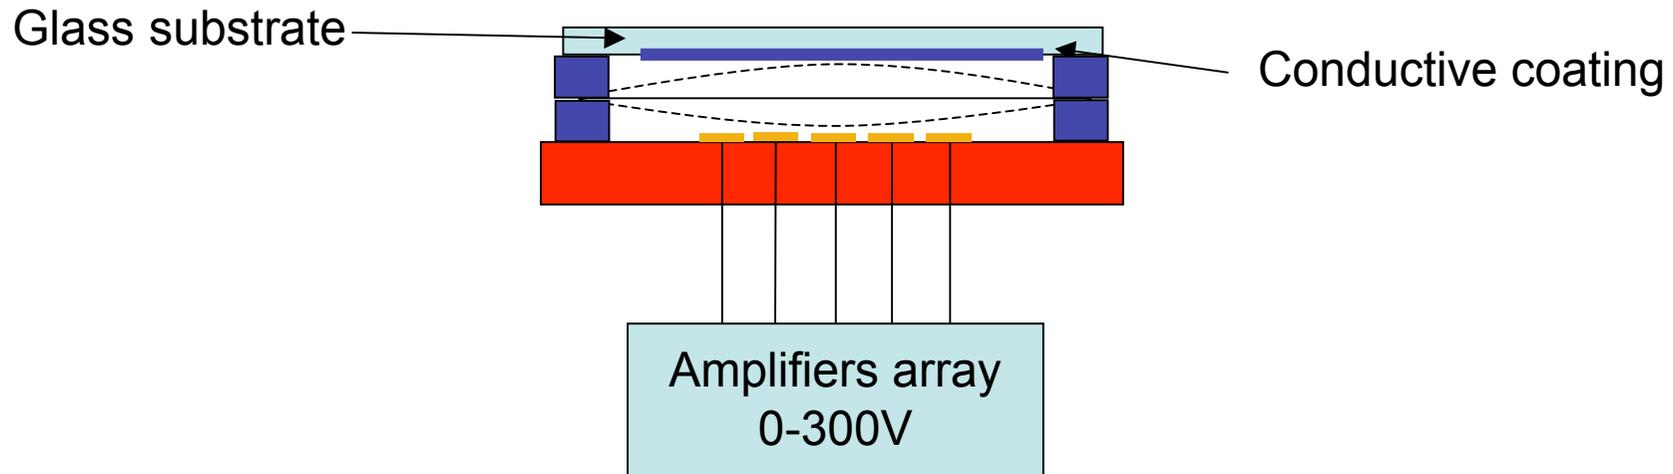

- Electrostatic attraction between PCB and thin membrane
  - Voltage 300V
  - Low power
  - Low cost
- Fragile ☹
- Not possible to clean ☹
- Only attraction is possible ☹

- Electrostatic push-pull mirror with single transparent electrode
  - Electrostatic push-pull mirror with patterned electrodes
- Electrodes managing  
P-P vs. P. only  
Application to ultra-fast optics

## Push Pull mirror with single transparent electrode

- Electrostatic attraction between PCB and thin membrane  
Transparent conductive coating (Indium Tin Oxide)
- Low cost
- ~~Fragile~~ ☺
- ~~Not possible to clean~~ ☺
- ~~Only attraction is possible~~ ☺

the device

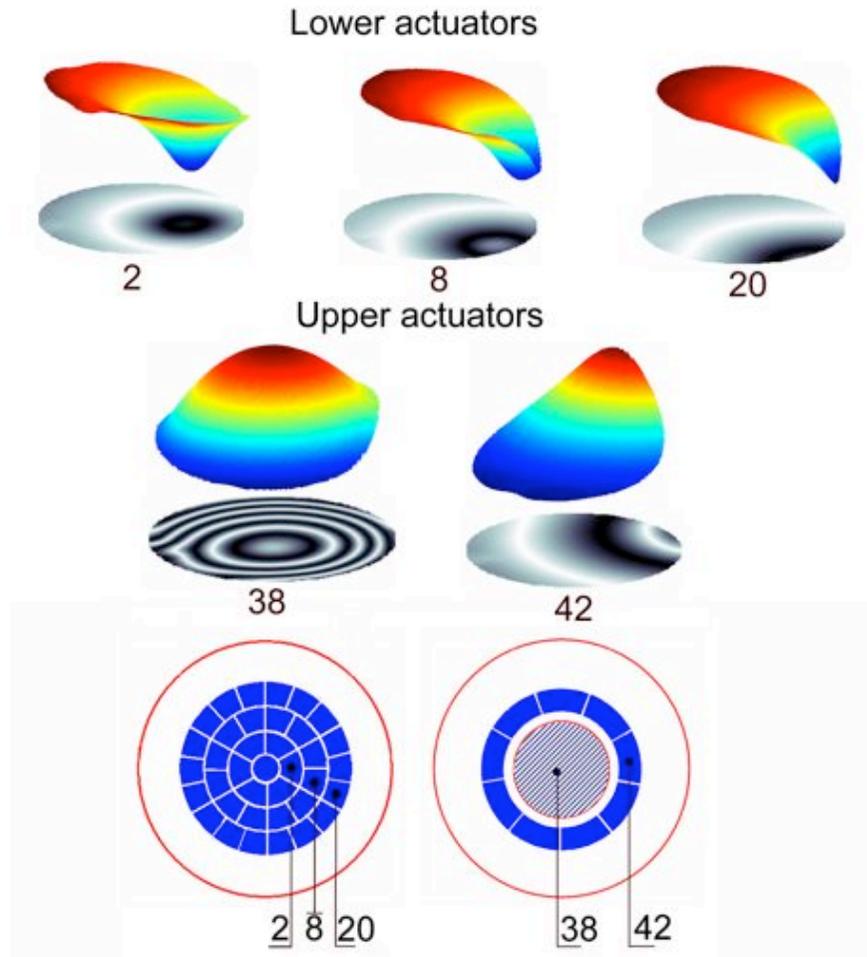

Flat membrane  
measurement  
using Zygo  
interferometer

An influence  
function

## Experimental results

Influence function Matrix measured by Zygo interferometer

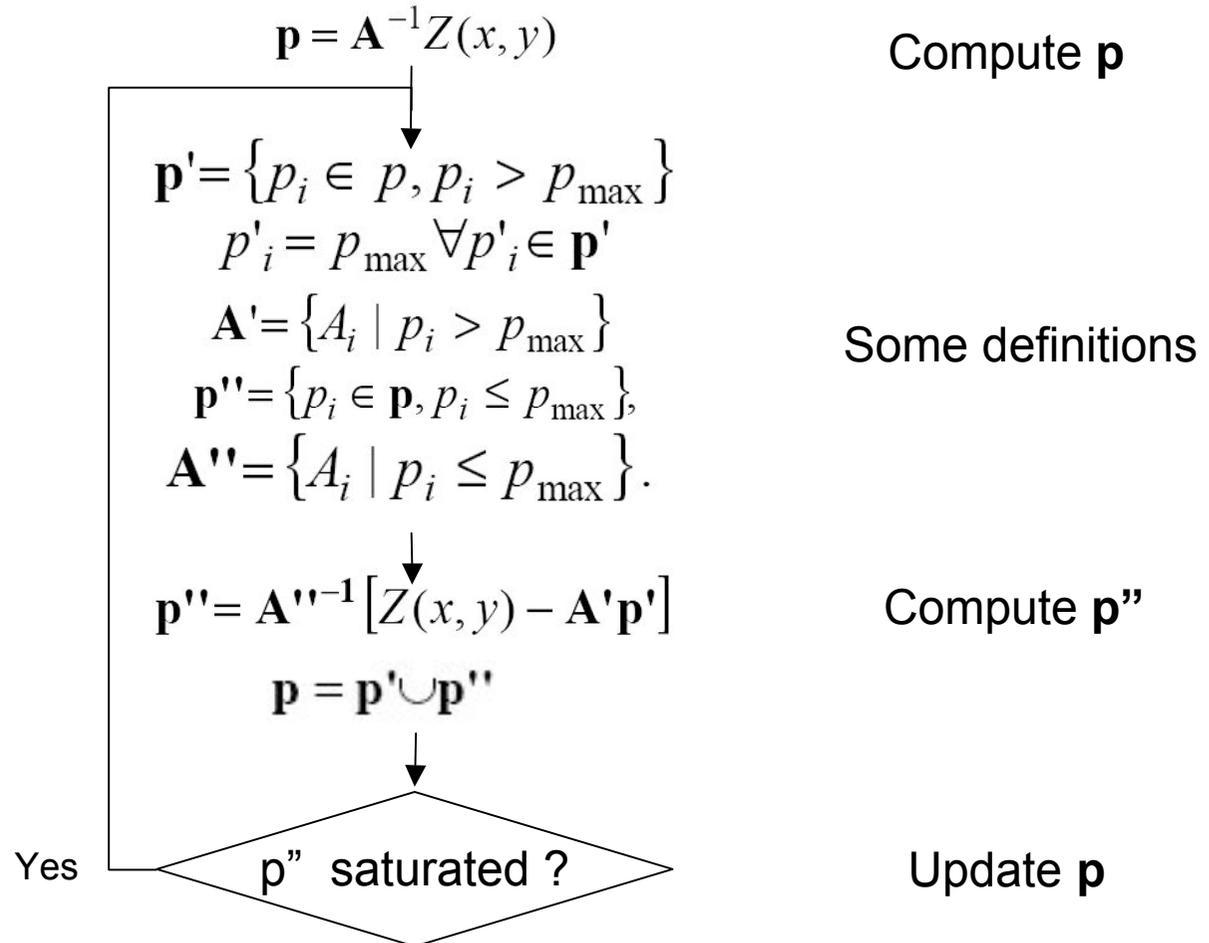

External ring 0.8  $\mu\text{m}$  1.3  $\mu\text{m}$   
 Positive displacement  
 2.5  $\mu\text{m}$  PTV

Upper actuators 3  $\mu\text{m}$

## Zernike polynomials generation

- Problems
  - Avoid electrodes Saturation
  - Exploit the mirror capabilities

## Geometry: How to choose the optimal parameters

$$P_i = \frac{D_i}{\sqrt{D_1^2 + \dots + D_n^2}}$$

Purity

$$D_i = \langle M(x, y) \cdot \hat{\mathbf{z}}_i(x, y) \rangle$$

$D_i=1$  if the  $M(x,y)$  is parallel to  $\hat{\mathbf{z}}_i$

$\hat{\mathbf{z}}_i$  Zernike terms

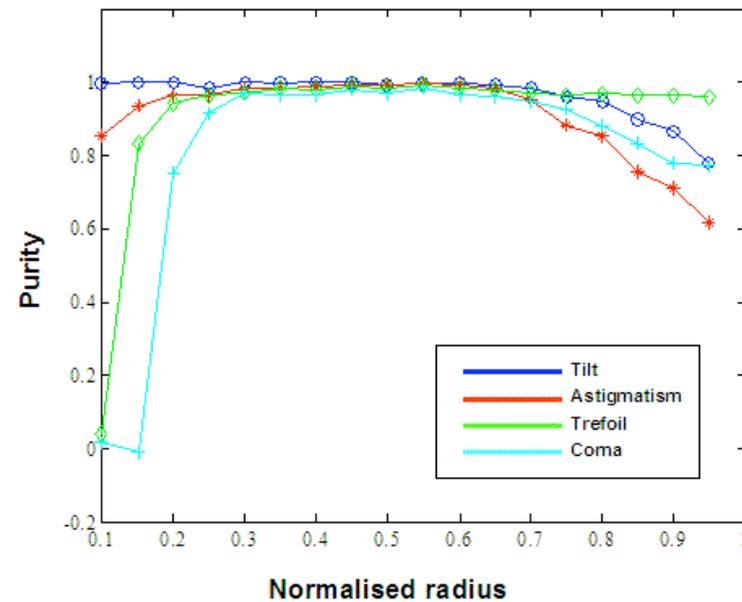

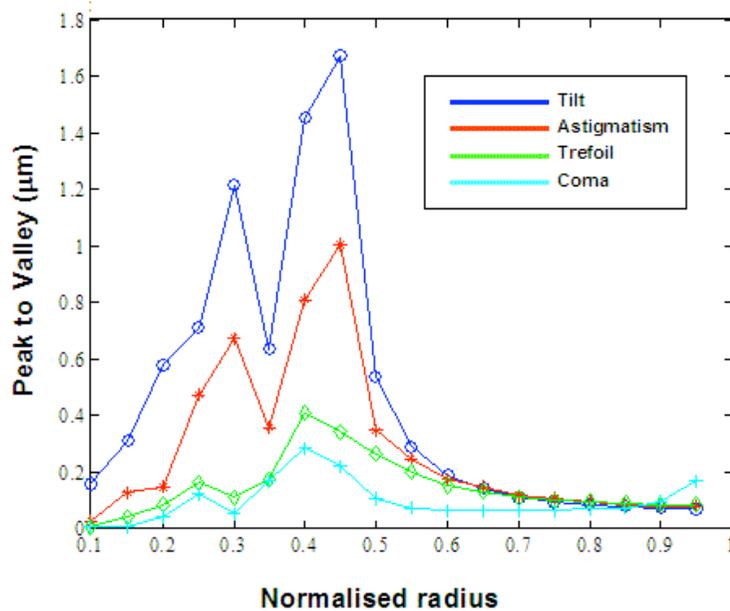

$$\mathbf{A} = [\mathbf{A}_1 \dots \mathbf{A}_{47}]$$

Influence functions matrix

$$\mathbf{p} = \mathbf{A}^{-1} Z(x, y)$$

# Active region

Optimal active region  $0.4 \times \text{Radius} = 10\text{mm}$

 Electrostatic push-pull mirror with patterned electrodes  
 ■ Electrodes managing  
 P-P vs. P. only  
 Application to ultra-fast optics

## Results

Aberration	Peak to Valley ( $\mu\text{m}$ )	RMS deviation ( $\mu\text{m}$ )	Purity
Tilt	1.6	0.14	0.93
Defocus	2.6	0.20	0.97
Astigmatism	2.1	0.12	0.96
Coma	0.3	0.05	0.83
Trefoil	0.9	0.10	0.92
(4,0)	0.6	0.11	0.41
(4,2)	0.2	0.03	0.61
(4,4)	0.4	0.09	0.80

Peak to valley/RMS < 18% (4,0)

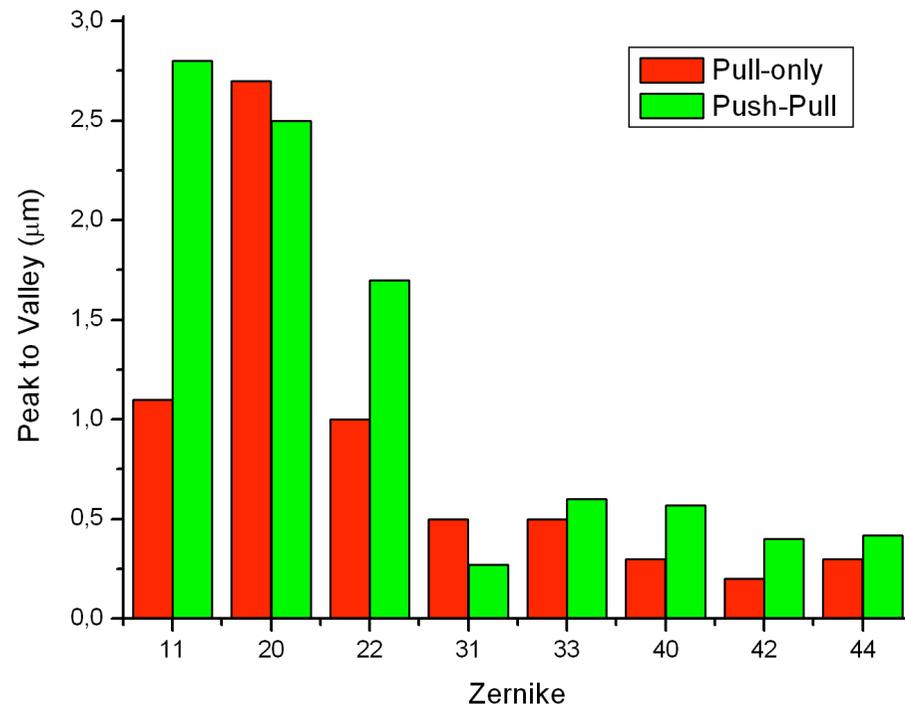

Measurements by Zygo interferometer

## Performance comparison

### □ Methods

- comparison of the peak to peak amplitude of aberrations with a pull mirror
- correction of a statistical distribution (human eye aberrations)

Results compared with a  
Membrane mirror  
D=18mm  
Active region 10mm  
Membrane biased at 140V

Electrostatic push-pull mirror with patterned electrodes

Electrodes managing

■ P-P vs. P. only

Application to ultra-fast optics

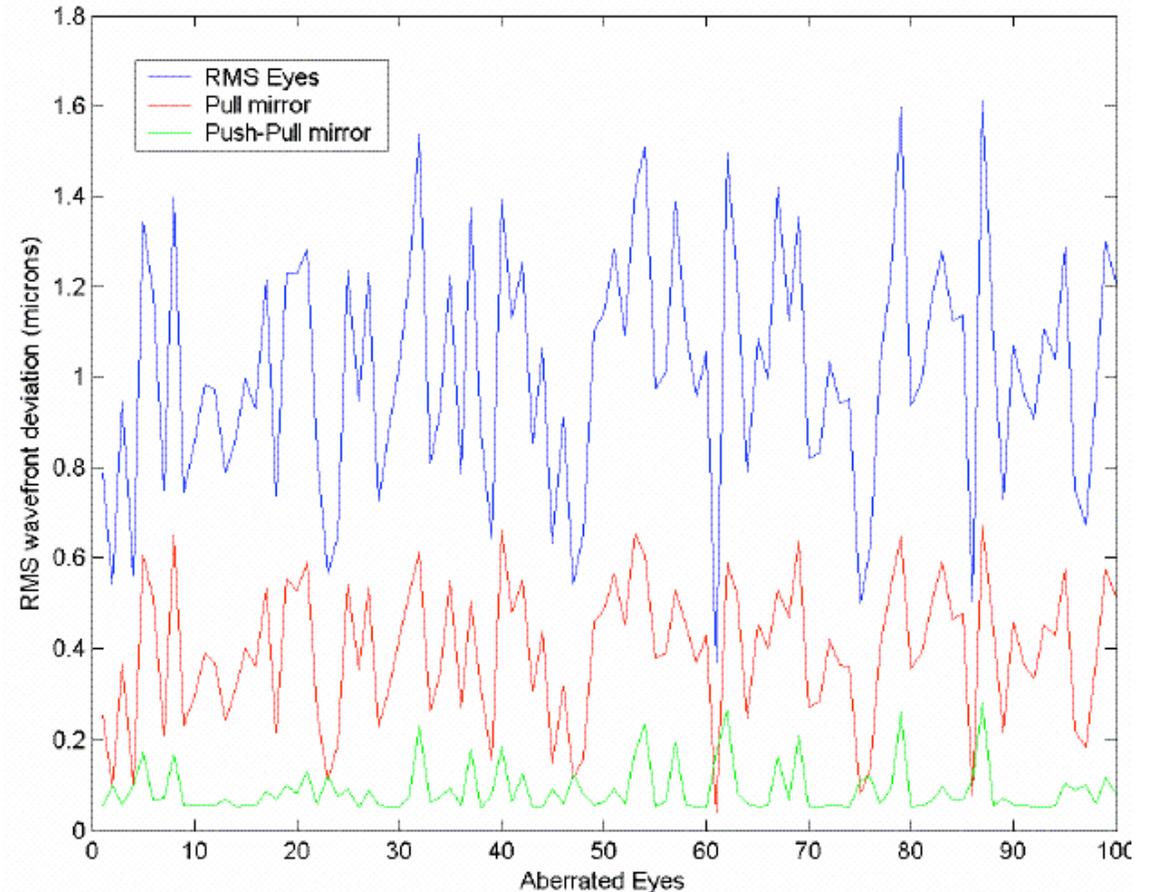

## correction of a statistical distribution

Young population with  
no visual problems

Pull mirror biased at half  
voltage

Push pull mirror, optical bias  
at the value of the average  
defocus

**Push Pull mirror average  
error is 3 times smaller!!!**

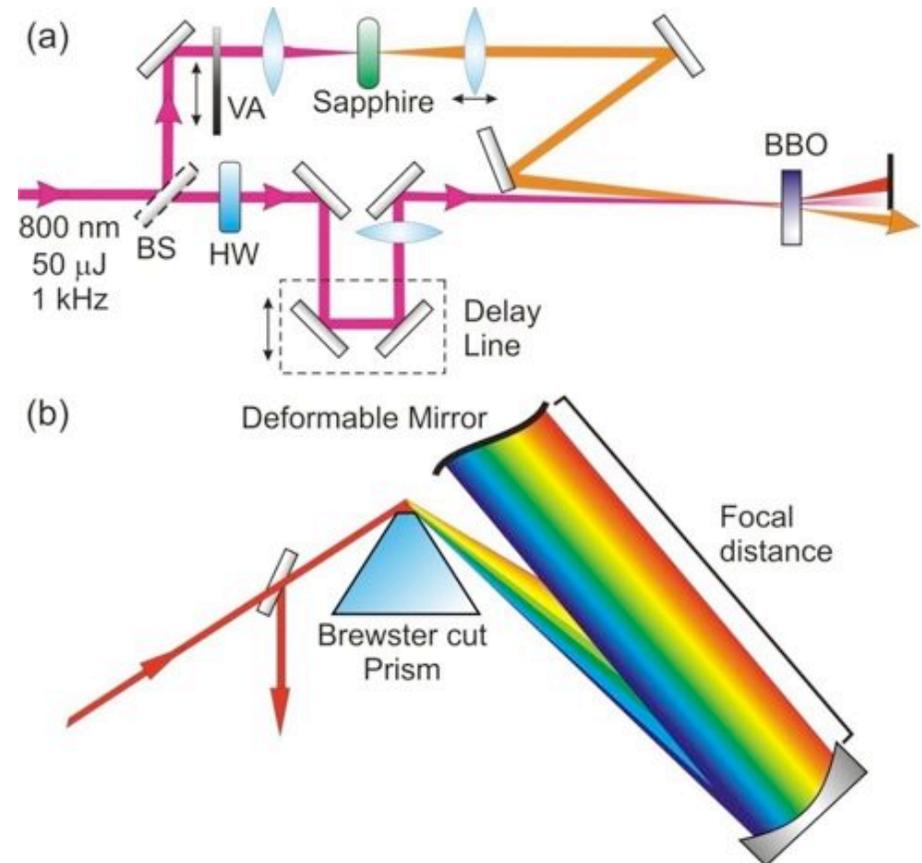

Human eye statistics:

J.F. Castejon-Mochon, N.Lopez-Gil, A.Benito, P.Artal "Ocular wave-front aberration statistics in a normal young population", *Vision Research* **42**, 1611–1617, (2002)

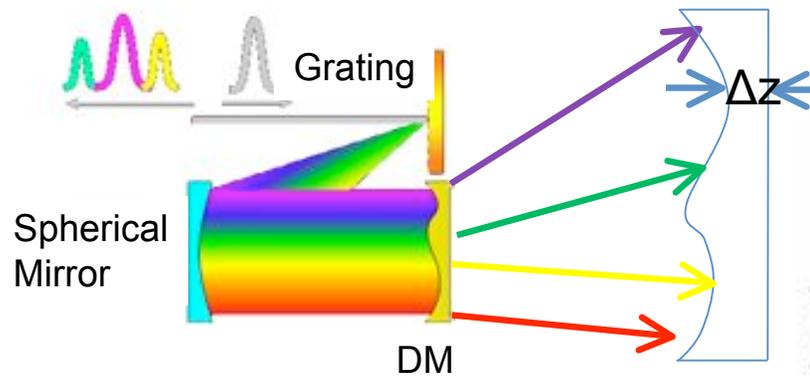

## Applications to ultrafast optics

- ❑ Generation of IR transform limited fs pulses by OPA
- ❑ Observation of photo-induced phase transition in fs time scale
- ❑ DMs for petawatt lasers and relativistic regime
- ❑ Source
  - ❑ Laser source Ti:Sh 795nm  
150fs, 80μJ 1kHz
  - ❑ OPA parametric process in BBO with NIR source and white light in Sapphire plate
- ❑ Compressor
  - ❑ IR pulse at 1.6μm compressed by 4-f closed by a linear deformable mirror

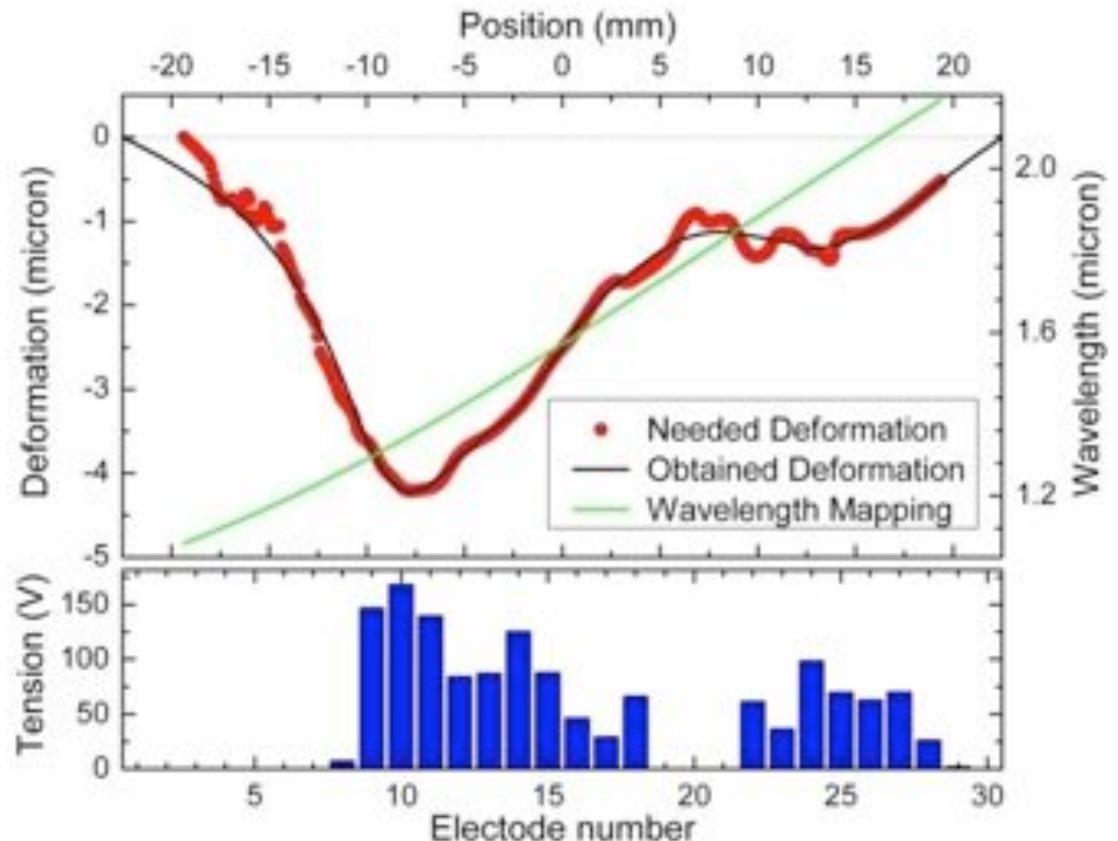

## Mirror design for 4-f compression

$$\Delta\varphi(x) = 2 \frac{2\pi}{\lambda} \Delta z(x)$$

The mirror can fit the phase

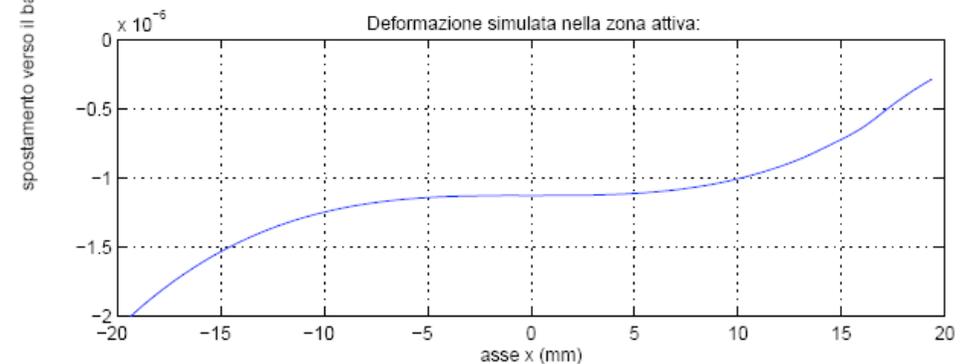

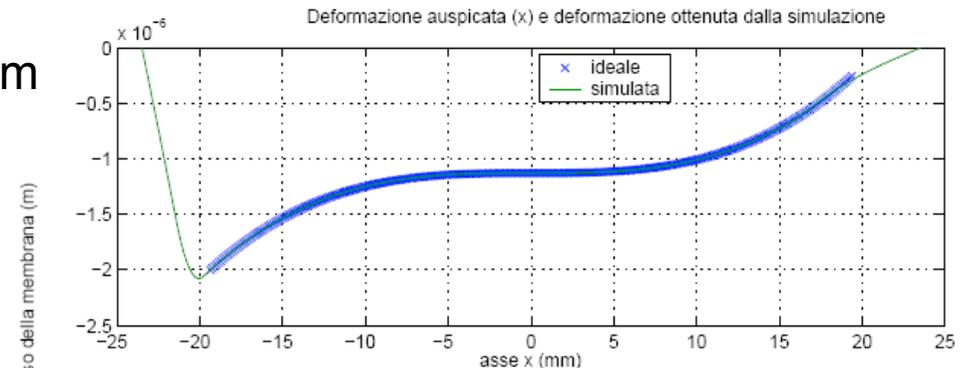

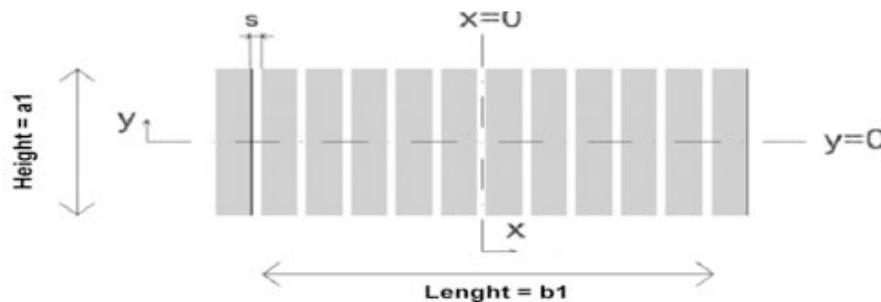

Maximum voltage used 150V

## Mirror design for 4-f compression

- Linear mirror
- Membrane electrostatic 15mm x 47mm
- Max deflection 10 $\mu$ m
- Ideal parameters: active region 0.95 length
- 30 actuators

DEPARTMENT OF

Deformable mirror developed in Padova

Behavior

Electrostatic push-pull mirror with single transparent electrode

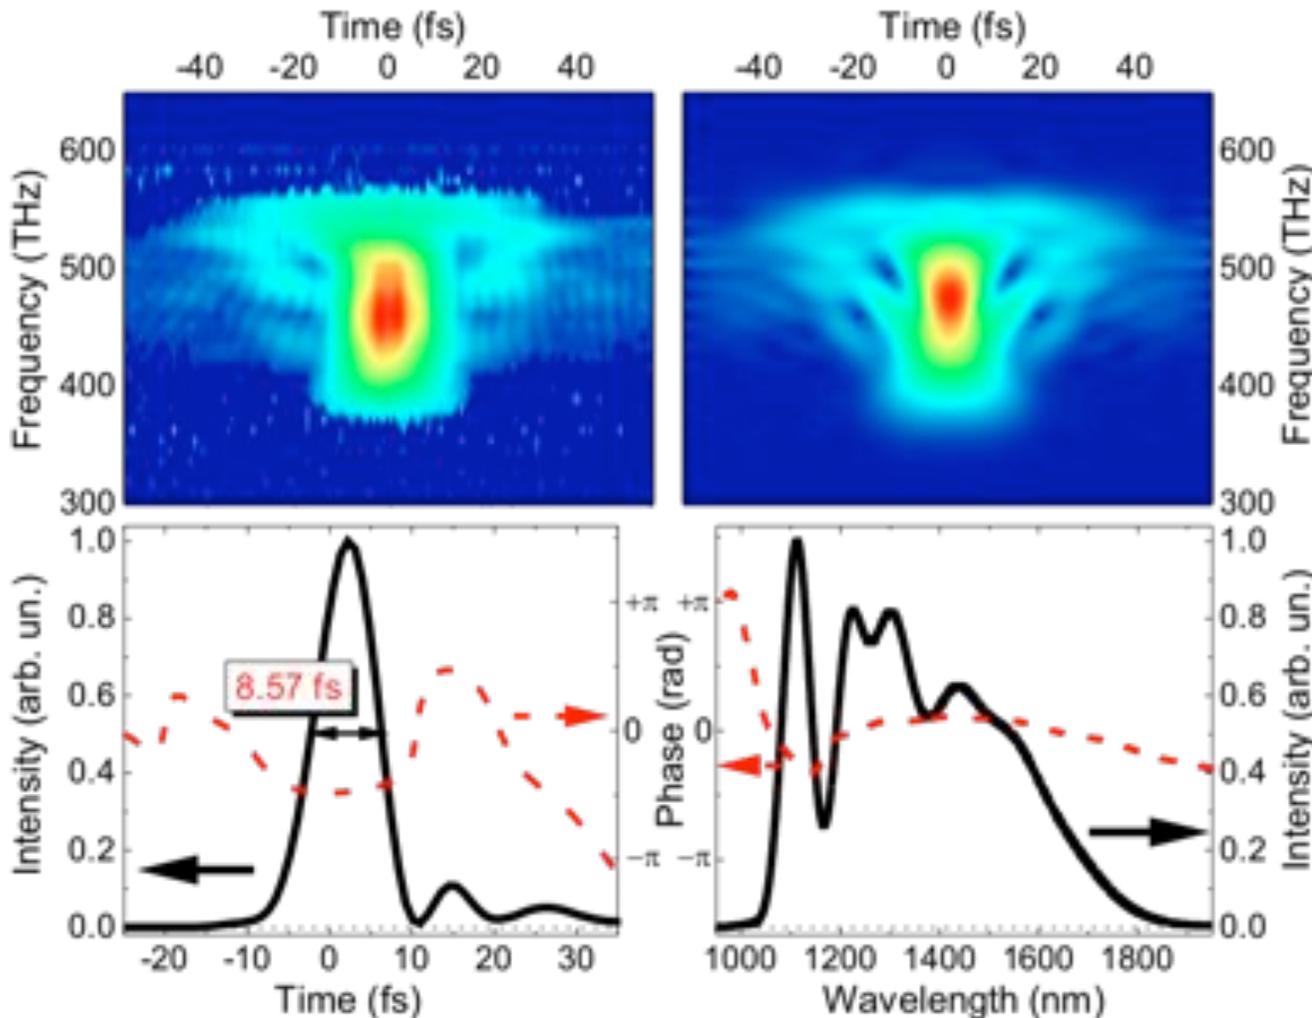

Electrostatic push-pull mirror with patterned electrodes

Electrodes managing

P-P vs. P. only

■ Application to ultra-fast optics

## Mirror design for 4-f compression

## SHG- FROG Pulse Characterization

8.57 fs

Present world record!!

1.5 optical cycles

Useful for pump-probe  
Experiment

Next steps:

□ Push-pull mirror  
capabilities

for pulse shaping

□ Extend the working  
principle to UV region.
